Description

The IC755ACC07PRO kit is a screen protector kit that comes in the accessories catalog of the Quickpanel+ series by GE Fanuc. The Quickpanel+ operator interface terminals come with a 7-inch widescreen display that consists of a TFT liquid-crystal display type of screen. This screen comes with a resolution of 800 x 480 pixels and it has a LED Backlight. The Quickpanel+ operator interface terminal screen is a touch panel and it provides a multi-touch mechanism that can be touched and controlled at up to 2 points. The GE Fanuc IC755ACC07PRO screen protectors kit includes 3 units that are meant to be used as protective devices. Since the screen of the Quickpanel+ terminals is controlled with a stylus or directly by the users' fingertips, damages to the screen can happen very easily.

To avoid screen damages, it is recommended to acquire and use the GE Fanuc IC755ACC07PRO screen protectors kit. These screen protectors cover the screen and diminish the scratches and other damages that can be caused to the screen due to its constant use. It is also recommended that users operate the screen with a proper stylus or with gloved hands and avoiding using the screen with sharp objects that can damage both the screen protector and the screen itself. Since the GE Fanuc IC755ACC07PRO screen protectors kit comes with 3 units, an old screen protector can be replaced with it wears out. A worn out screen protector may diminish the glow of the screen it protects, which means that a new screen protector can increase the brightness of the screen and at the same time provide a greater degree of protection to the screen than the old and worn out screen protector. These screen protectors cover the entire 7 inches of the screen.
